Technical Skills

Languages & Tools: C++, CUDA, Python, PyTorch, TensorFlow, NumPy, CMake, Git

Spoken Languages: English (C1/C2), Polish (Native), German(Basic)

Experience & Open Source

GradCraft (Custom Deep Learning Framework)

May 2026 – Present

Creator & Core Engine Developer

- Created a 12,000-line C++/CUDA deep learning framework and lazily-evaluated autograd engine with zero external AI dependencies.
- Programmed custom device-aware memory pools for CPU and CUDA to eliminate memory allocation overhead during training loops.
- Built core computational graph classes (Tensor, TensorState, Node, Storage) to support zero-copy tensor views and aliasing.
- Implemented fused CUDA math kernels, omitting dispatching chains of primitive operations to achieve speedups between 2x and 100x on layers such as Causal Softmax or RMSNorm.
- Developed a standard PyTorch-like frontend (Module, Parameter, AdamW Optimizer) for quick prototyping.
- Trained MALLMOC, a 180M parameter GPT model, locally on an RTX 3090, achieving 45-50% PyTorch eager-mode throughput. It converged and outputs correct code.

Mathwise (EdTech Startup)

June 2024 – May 2025

Core Developer (4-Person Team)

- Functioned as a core developer in a small 4-person team, working with the founder to decide on architecture, prototyping, and what goes into production.
- Engineered an AI feature using Gemini Vision API, writing prompts to force the model to extract bounding boxes out of users' solutions and verify step-by-step mathematical accuracy.

Additional Projects

Custom Audio Denoiser (LSTM) | *Python, NumPy*

January 2025

- Built a speech enhancement neural network from scratch using raw NumPy, manually implementing an LSTM with Backpropagation Through Time (BPTT).
- Engineered custom Short-Time Fourier Transforms (STFT/ISTFT) to convert audio into frequency spectrograms and predict noise suppression masks.

Lyme Disease Detection Pipeline | *TensorFlow, Computer Vision*

October 2025 – January 2026

- Created a 3-stage hierarchical vision pipeline to sequentially reject non-skin images, filter out distant or blurry photos, and run the final skin lesion classification.
- Deployed hyperparameter search to identify the best CNN backbone combinations for feature ensembling, along with tuning classification head dimensions and learning rates.
- Evaluated model performance and optimized decision thresholds using PR AUC, ROC AUC, Precision, and Recall, avoiding using solely accuracy for a greatly imbalanced dataset.

Education

Warsaw University of Technology

Warsaw, Poland

BSc in Computer Science

October 2026 – February 2030

XXXIII LO im. Mikołaja Kopernika

Warsaw, Poland

High School (Matura)

September 2022 – May 2026
